

FOR IMMEDIATE RELEASE**Announcing the OnTime System - Software for couriers, by couriers**

Medford, OR – June 6, 2006 - Vesigo Studios announces the launch of the OnTime System, a new and innovative line of software for the courier industry. OnTime was developed and tested from the ground up in conjunction with actual couriers. This makes it a flexible and cost effective tool for small to mid-size couriers.

Jeremy Tilley, the Director of Software Development, explains OnTime's philosophy, "Couriers have invested a lot of time into setting up their business. Unlike other management programs, the OnTime System doesn't insist you change the way you currently do things. Instead it uses a flexible approach allowing you to automate the way you do things."

OnTime features include:

- A unique payment calculator which allows for pay rates to be set up in several ways and automatically calculate wages.
- One of the most powerful pricing systems in the industry that consistently and accurately calculates pricing in hundreds of ways.
- The ability to automatically schedule routine vehicle maintenance.
- Mileage calculations between locations are provided with a single click.
- Customizable web portal that allows customers to self-dispatch, check delivery status, and view P.O.D. in real time.
- A smart planning feature that suggests the best driver for a particular order.
- Broad compatibility and support for whatever mobile device or service provider a company is using.
- Starts with a low entry fee and usage charged on a daily basis. This works for small to mid-sized companies where demand fluctuates. During slow times, only pay for active users but easily scale up when demand increases.

OnTime uses the customer's current investments of time, resources, and equipment to give them the same benefits enjoyed by bigger companies. Companies that are interested in learning more can order a complimentary evaluation kit at www.ontimesystem.com.
